## Tube Fittings

### General Information for JIS B2351 Tube Fittings.

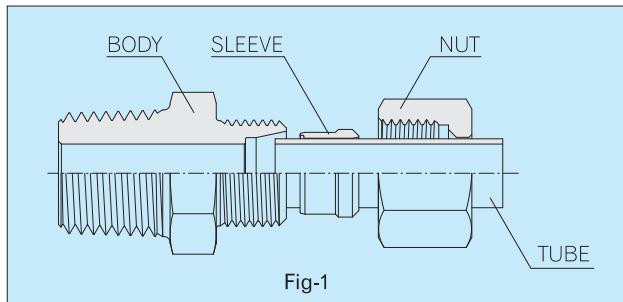

JIS B2351 tube fittings are precision machined, under strict quality control.

JIS B2351 tube fittings are the flareless tube fitting with the visible bite.

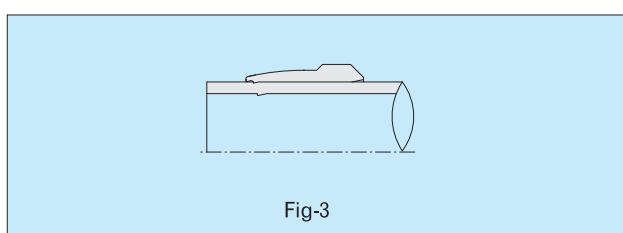

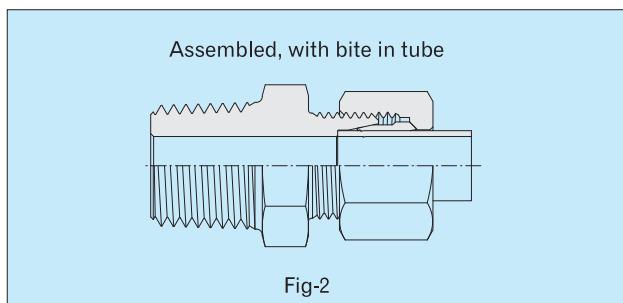

This added safety feature makes Hy-Lok Corp. JIS B2351 tube fittings the preferred fitting for non - flared tube connections.

### How Do They Work?

The JIS B2351 tube fitting was designed to work on medium to heavy wall tubing which was hard to flare and has three parts : 1. body, 2. sleeve, 3. nut. (As shown in Fig-1)

The sleeve is driven forward on the tube by the nut. As the sleeve moves forward it meets the seal seat angle of the body which causes the sleeve to cam inward into the tube. The sleeve then bites into the tube causing a small ridge of tube material to be pushed up in front of the biting edge of the sleeve. (As shown in Fig - 2 & 3)

The make up of the fitting is critical in that the tube must be bottomed against the tube stop in the body or presetting tool during make up. If it is not bottomed the tube will move forward with the sleeve and a bite will not be achieved. Make sure the tube is bottomed.

A check is possible to see if the tube was bottomed during make up. To make this check look at the end of the tube, and notice if a circular appearing ring has been impressed into the tube end face. This impression will be caused by the tube stop which has a slight reverse angle rather than a flat face.

### Material Specifications

	C. Steel	S. Steel	Brass
Forged Bodies	S20C - S48C	SUS316, 304	C3771
Cold Formed Bodies	S10C - S20C		
Barstock Bodies	S20C - S48C	SUS316, 304	C3604
Cold Formed Nuts	S10C - S20C		
Barstock Nuts	S20C - S48C	SUS316, 304	C3604
Sleeves	S10C	SUS316, 304	C3604

### Applicable Pressure Rating

Our standard specifications of the fittings, which are shown in the catalog, are as below :

Fitting size (applicable Tube O.D.)	4	16	25	30	40
	~15	~22	~28	~38	~50
Rated pressure (kgf/cm <sup>2</sup> )	C. Steel S. Steel	500	400	350	250
	Brass	250	210	170	150

Max. working temperature (°C) 300

The Rated Pressure for the fittings are determined based on the results of severe repetitively conducted tests and the design calculation ; precisely, the rated pressures are determined for each size of fittings while the safety factor of as much as 4 is taken into account in the design.

### Suitable Tubing Materials

Common material of tubing best suited for industrial service, and in accordance with various Industry Standards and recommendations of tubing manufactures, include :

#### Carbon Steel -

Seamless, fully annealed, also welded and redrawn type suitable for bending. Maximum hardness, Rockwell B72.

The Applicable Tubes to the fittings entered in the catalog and which we recommend are as follows :

Carbon Steel Precision Tubes for Hydraulic Line Service, JOHS - 102, OST - 2 (The Oil Hydraulic Association Standards) or Equivalent Refer to page 54 of this catalog for the comparison chart between this Standard and other Standards for easy selection.

#### Stainless Steel -

Seamless, fully annealed and welded redrawn, fully annealed suitable for bending. Maximum hardness, Rockwell B90.

#### Copper -

Seamless coils, soft or light annealed, maximum hardness Rockwell F55. Straight lengths, light drawn and general purpose, maximum hardness of 60 on Rockwell 30T scale.

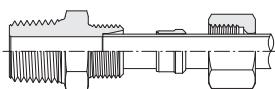

## Assembly Instructions

### Cutting The Tube

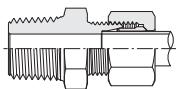

Cut tube squarely and lightly de-burr the end internally and externally.

### Sleeve Placement

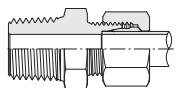

Slip nut and sleeve onto tubing. Be sure the long, straight end of the sleeve points toward tube end.

Nut and sleeve on tube

Tube bottomed in fitting

Assembled with bite on tube

### Lubrication

Lightly lubricate threads on tool or body as well as the tail and lead end of the sleeve with an extreme friction lubricant.

### Pre - Setting

Insert tube end into tool or fitting until it bottoms against the shoulder (to hold tube motionless during pre - setting operation) and screw net down finger tight.

### Final Setting

Wrench nut down 1-1/4 turns to pre-set the sleeve (Reliable make up of all flareless tube fittings is dependent upon the sleeve traveling a prescribed distance into the tapered fitting throat in order to bite into the tube and effect a positive grip and seal).

### Reassemble for Final Installation

Insert the tube into the fitting body and wrench the nut down easily until a sudden increase in torque is evident. From this point turn the nut an additional 1/4 to 1/3 turn (1-1/2 to 2 wrench flats) to again spring the sleeve into place to seal against the tubing and the fitting body.

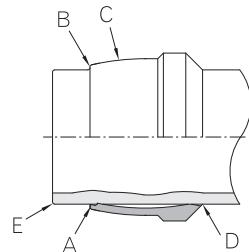

### Inspection of Bite

All Hy-Lok's JIS B2351 type tube fittings must be disassembled and inspected for proper make-up before final assembly.

Detailed inspection procedures are outlined below and must be followed regardless of the method used to pre-set the sleeve to the tube.

### You Should Make Certain That

1. A ridge of metal has been raised above the tube surfaces, to a height of at least 50% of the thickness of the sleeve leading edge, completely around the tube (A).
2. While the leading edge of the sleeve may be coined flat (B) there is a slight bow to the balance of the pilot section (C).
3. The tail or back end of the sleeve is snug against the tube (D).
4. There is a slight indentation all around the end of the tube (E) that indicates the tube was bottomed in the tool or fitting during pre-setting (unless evidence of this complete contact is visible the sleeve cannot be considered properly pre-set).

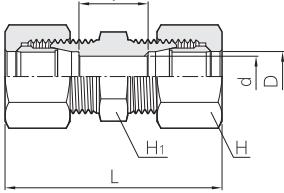

5. Avoid rotating the sleeve. Steel sleeve should not be capable of moving back and forth along tube, beyond the bite area (stainless steel sleeve will move more than steel because of its spring back characteristics).

### Trouble Shooting

Problems with JIS B2351 type tube fittings are most often traced to faulty make up procedures. Look for the following :

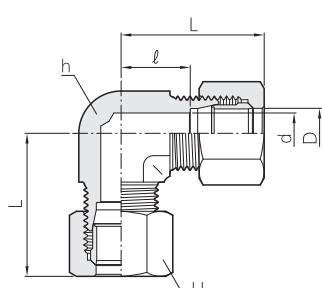

1. Tube not bottomed - Check for the indentation on the tube end or compare length from end of tube to the front end of the sleeve of a known good assembly to that of the assembly in question.
2. Lack of bite - Inspect for turned up ridge of material. A failure to achieve this ridge can be traced either to the fact that the nut was not tightened enough or that the tube was not bottomed against the stop which allowed the tube to travel forward with the sleeve
3. Sleeve cocked on tube - The sleeve is cocked on the tube when the tube assembly is off axis with that of the body. Generally this condition is caused by faulty tube bending. All bent tube assemblies should drop into the fitting body prior to make up.
4. No bite - If all of the above checks have been made and the sleeve still shows no sign of biting the tube, it may be that the tube is too hard.

## Straight Union **BU**
